JC12 PCT/PTO 25 APR 2005

[Handwritten signature]

IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

Applicant : Johannes SCHALLER et al
Based on : PCT/DE 03/03562
Filed : April 25, 2005
Title : DEVICE FOR TREATMENT OF EXHAUST OF AN
INTERNAL COMBUSTION ENGINE

Docket No. : R.304062
Customer No. : 02119

Commissioner for Patents

Alexandria, VA 22313-1450

**INFORMATION DISCLOSURE STATEMENT UNDER 37 CFR 1.97(b),
AND EXPLANATION OF THE RELEVANCE OF THE CITED PRIOR ART**

Sir:

The undersigned hereby requests that the prior art cited on the attached prior art statement be placed of record in the application file and be considered by the examiner.

This citation of prior art is made under 37 CFR 1.97(b), since it is being filed within three months of the filing date and before the mailing of a first Office action.

The relevance of the prior art cited on the attached form PTO/SB/08a is as follows:

US 6,442,932 B1

This patent teaches a method and device to ensure the maximum possible conversion of nitrogen oxides in a DeNOx catalytic converter in an off-gas cleaning installation for reducing nitrogen oxides. The system also prevents the reducing agent used for the reduction from escaping into the environment. There is a provision for the density of a reducing agent solution to be used to determine the volume of the reducing agent solution which is to be metered. The density is regulated in two ways; the temperature of the reducing agent solution is measured using a temperature sensor and the temperature is also set by a temperature-control device.

DE 199 35 920 A1

This patent teaches an arrangement for a heating element (20) in a reduction agent reservoir container (10), which is connected to the cooling system of an engine via feed (19) and return (21) lines. The feed and return lines are arranged with respect to each other over at least part of their runs so as to form a heat exchanger. They are arranged parallel to each other in close thermal contact with opposite flow directions.

DE 44 32 577 A1

This patent teaches an assembly (2) for the introduction of a liquid (4) into a flowing medium (5) from a supply vessel (6) and feed pipe (12) outlet (22) incorporating a back-flow prevention valve (20) supplied by a gas under pressure (29). The liquid supply pipe (12) may be linked to other assemblies such as a filter (16) and a three-way pump (18) for back-flushing.

Appl. No. Unknown

Prior to first Office Action

WO 00/30733 A1

This patent teaches a liquid urea exhaust gas treatment additive. Methods for the treatment of combustion effluent containing nitrogen oxides are provided. According to these methods, the combustion effluent is treated with a liquid treatment additive composition comprising urea, water and an oxygenated organic compound, in the presence of a catalyst. The treatment additive compositions of the present invention have lower freezing points than water/urea solutions, which allows use and storage of the treatment additive at temperatures below 10 degrees Fahrenheit (-12 degrees Celsius), if necessary.

WO 02/057603 A1

This patent teaches a device for metering urea solutions, which allows in particular the level of nitrogen oxide in the exhaust gas stream of an internal combustion engine to be reduced in a reliable manner. According to the invention, in order to meter the urea solution, the device comprises a sensor unit (1) for controlling one or several physical condition variables of a urea solution that is devoid of enzymes.

Examination of this application is respectfully requested.

Respectfully submitted,

Ronald E. Greigg
